### Easily identify

whether order items are for inventory or internal use, such as office supplies.

### Make smarter choices

Provide instant access to purchasing information. Flexible vendor ID structures provide meaningful identification and help you analyze vendor performance for more informed decisions.

### Work the way you want

Flexible setup options fit the way you work and can be changed as your operations evolve. Define default shipping addresses, printing options, and data retention periods. Or, specify default general ledger accounts and decimal precision options.

### Gain efficiency

Enter purchase orders, receipts, and vouchers – at the most sensible times in the cycle – quickly and easily through the seamless integration of information inherent in all Microsoft Solomon modules.

### Streamline processes

Enter simple purchase orders with only three pieces of information: vendor ID, inventory item ID, and quantity. Everything else – including unit cost, unit of measure, and account/sub-account information – is entered by default, based on your business rules.

### Maximize buying power

Make informed decisions using a variety of targeted reports that help you negotiate the best prices by understanding what products and services your company needs, the right time to order them, and the best vendors.

## PURCHASING | FEATURES AND FUNCTIONALITY

<b>Instant Updating</b>	Update inventory immediately, rather than when the vendor's invoice arrives. Simply enter the packing slip PO number when an order arrives to create a receipt on the spot.
<b>One-Step Invoice Accounting</b>	Create accounts payable vouchers automatically when purchase orders are received, helping eliminate redundant data entry.
<b>Targeted Reports</b>	Create reports with Crystal Reports and save in various formats, including Microsoft Office Excel, Microsoft Office Word, IBM's Lotus, Open Database Connectivity (ODBC), and HTML. Reports include purchase order register, purchase order status/history, and anticipated deliveries.
<b>Multiple Order Type/Addresses</b>	Bill any type of order to one address and ship it to another. Purchasing supports multiple ship-to addresses as well as a variety of order types, including regular, standard, blanket, and drop ship orders.
<b>Flexible Receipt Processing</b>	Track open orders, override unit costs, and receive quantities larger than original orders. Units of measure, which can differ from an item's stock unit, are automatically converted on receipt to stock unit measures, to update inventory accurately.
<b>Robust Integration</b>	Microsoft Solomon Purchasing integrates with other Microsoft Solomon modules, including Accounts Payable, Inventory, and Order Management, to reduce redundant data entry and improve overall efficiency.
<b>Inventory/Non-Inventory Identification</b>	Distinguish between stock and non-stock items by indicating on the PO whether items are for internal use, such as office supplies, or for inventory, such as resale or production items.
<b>Change Order Support</b>	Maintain comprehensive, long-term records on purchase order activity, including up to 99 change orders such as quantity, price, and shipping instructions.
<b>User-Specified PO History</b>	Specify during setup how long you want to keep information stored in your Purchasing system. Purchasing supports up to 99 periods of transaction detail.
