Microsoft Business Solutions—Solomon 6.0

Simplify your business management experience with the enhanced functionality of Microsoft Business Solutions—Solomon 6.0, a powerful and comprehensive solution for project-, service-, and distribution-driven organizations. Microsoft Solomon and Microsoft SQL Server™ technologies provide an open architecture that helps consolidate data across your business and extend information and processes across applications and platforms such as Microsoft Business Solutions Business Portal.

Enhancements in this release of Microsoft Solomon help you run your business projects more effectively, manage customer accounts better, and improve your sales efforts. In addition, the improved ability to transform data into meaningful information further empowers your employees to boost your organization's effectiveness.

With Microsoft Solomon, you can leverage a single, integrated system that effectively links all aspects of your business. From project management, distribution, and e-business to financial management, field service, and payroll, you'll gain the ability to excel in your industry, deliver exceptional customer service, increase the velocity of your business transactions, and work effortlessly with partners and customers anytime, from any location.

Achieve more
—with Microsoft Solomon 6.0.

Outshine the Competition

Built to help you better handle customer accounts and improve sales efforts, Microsoft Solomon 6.0 empowers your business with tools that can increase employee effectiveness, enrich business decisions, and focus the power of the Web to handle everyday tasks.

Run Projects More Effectively – Consolidate accounting and project data into one integrated system—accessible from anywhere—and watch your project efficiency, realization, and profitability grow. Microsoft Solomon 6.0 helps you improve utilization by easily assigning valuable resources to tasks. And US Federal Government Contractors and Construction companies will benefit from specific industry-focused enhancements.

Manage Customer Accounts and Improve Sales Efforts – Tap into powerful new features like Consolidated Invoicing to help communicate with customers more effectively and improve the productivity of invoicing.

Empower Your Employees and Boost Effectiveness – An enhanced user interface translates into lower training costs by helping users navigate through the system more easily. And now you can harness the power of the Web to manage common tasks via Microsoft Business Solutions Business Portal and your Web browser.

Transform Data into Meaningful Information – The latest reporting and budgeting tools, including Crystal 10 and Microsoft Business Solutions for Analytics–FRx® 6.7, make it easy to generate reports tailored to the needs of each individual user and deliver them in a single, all-inclusive report book.

Significant New and Enhanced Features of Solomon 6.0

Improved, Role-Based Menu

Interface – Empower people across your organization to navigate Microsoft Solomon systems more easily—and be more productive—than ever before.

Integration to Business Portal 2.5 – Access the information in your Solomon system securely via an Internet browser. Review a snapshot of key performance indicators about your business, enter time cards, query data, and export it to Microsoft Office Excel for further analysis.

Unified Project Desktop – Heighten your organization's productivity with anytime, anywhere access to Solomon information and processes via Microsoft Business Portal 2.5.

Resource Assignment Capability – Easily allocate assignments for people and other resources (such as equipment) with new Project Controller processes that help managers and team members improve productivity and profitability.

Consolidated Invoicing – Delight your customers by allowing them to specify the way that they want to be billed (by shipper, contract, purchase order, addresses, and more).

Foundation

Provide people across your organization with enhancements that increase productivity by improving users' navigation, data entry, and database administration experiences.

Business Portal 2.5 Integration – Microsoft Business Portal—built on Microsoft Windows® SharePoint™ Services and Microsoft .NET technologies—is integrated seamlessly with Microsoft Solomon to deliver applications, information, and processes to employees across your organization. User-specific access to Solomon information and processes via Microsoft Business Portal translates into enhanced productivity for your organization.

Enhanced Menu Interface – An intuitive Microsoft Solomon Home Page menu builds dynamically for each user, allowing them to navigate through the system easily. And because the menu builds from individual access rights, users see a simplified list of only those screens and reports specific to their roles. Users can add frequently used screens, reports, Web sites, and other applications to a helpful Favorites list for quick and easy access. And to make switching between functions easier, the personalized Home Page contains a new “Active Applications” pane that shows all open Solomon screens.

Role-Based Menu List – With the ability to customize menus to your users' specific tasks, you can display only the menu selections, screens, and reports that workers' organizational roles call for, instead of every Microsoft Solomon module and screen.

Simplified Data Entry – For easy identification, any required fields within a screen or report are now highlighted in the user's color of choice, offering graphical alerts to users about what data is required before a record can be saved. Plus, users can now include printer settings in saved templates, which allows a standardized template to be used at multiple locations.

Streamlined Database Maintenance – Back up and restore the database without leaving Microsoft Solomon, using the new Database Maintenance screen.

Group Customizations – To accommodate a new level of customizations for groups or departments of users, a customization Select Level has been added that allows administrators to deploy configured screens to all the users in a group at the same time. Because users can be assigned to a customization group, customizations no longer have to be created and then copied to multiple users. And when a user changes roles or moves from one department to another, making the change is quick and easy.

Microsoft Solomon 6.0 offers an enhanced menu system, with a user-specific, customizable Home Page that shows only those screens and reports for which the user has rights.

The addition of a Favorite menu offers quick access not only to frequently used Solomon screens and reports, but also to non-Solomon applications and URLs.

Navigating through a screen is easier with VCR style buttons in every screen.

Fields that require data are now highlighted with user-defined colors, making data entry quick and easy..

Easily set up Microsoft Business Portal to meet the unique needs of your business, as well as organize user access by appropriate roles in the Business Portal Site Settings Center.

Financial Management

Improve your organization's cash management and payroll handling with Financial Management enhancements. Microsoft Solomon 6.0 helps eliminate payroll errors and redundant data entry by enabling employees to record their own time. Additional enhancements help you better meet specific regulatory requirements, support common union reporting needs, and provide a better solution for specific industries such as Construction.

Accounts Payable Prepayment Application and Reversal – Keep your payables records up to date. Microsoft Solomon Accounts Payable now offers the flexibility that lets you make a prepayment to a vendor before receiving their invoice. Prepayments already applied to a voucher can be reversed and applied to a different document, so whether a payment is applied to a voucher by accident or intentionally, the transaction can easily be reversed and reapplied as needed.

Improved Flexibility in Payroll Management – To meet specific regulatory needs, you can now define the order in which each employee's deductions should be calculated. For example, FICA deductions may now be taken before Pension deductions if required by law.

Improved Flexible Union Reporting – New report formats support the most common union reporting needs. Now you can produce not only the actual hours an employee worked, but also represent any overtime pay, weekend pay, holiday pay, or other pay types to meet union reporting requirements.

Portal-Based Timecard Entry – Enable your employees to record their own time worked with Microsoft Solomon Time & Attendance within Microsoft Business Portal. This data flows automatically into the Solomon Payroll and

Project modules, so that payroll staff doesn't need to re-enter the data. Once the data is submitted, it is routed to management for approval and then submitted to the Payroll module for processing. In addition, time allocated to projects automatically flows to the Project Controller module for cost allocation.

Portal-Based Advanced Timecard Entry – For organizations that prefer not to have individuals enter their own time, project managers and others can record time worked by their team members via Advanced Timecard Entry in Microsoft Business Portal, with data automatically flowing into Microsoft Solomon Payroll and Project modules. Time allocated to projects automatically flows to the Project Controller module.

More Modules Offered in Microsoft Solomon Standard – To provide a better solution for specific industries such as Construction, Microsoft Solomon Standard now includes Advanced Payroll in its list of available modules.

Make prepayments to your vendors before receiving their invoice, or reverse existing payment applications for reassignment to another document.

Date	Hours	Earnings Type	Work Location	Submit for Approval	Delete	Status
05/31/2004	8.00	Holiday Used	Ohio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Not Submitted

06/03/2004	8.00	Regular	Ohio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Not Submitted
06/04/2004	8.00	Regular	Ohio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Not Submitted
06/05/2004	8.00	Doubletime	Ohio	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	Not Submitted

Allow employees to enter their own timecards whether they work in the office or remotely.

Project Management and Accounting

Increase visibility and control of your organization's project management and accounting functions. Microsoft Solomon 6.0 enhancements include improved support for government contractors and other industries to help you better manage worker activities and other resources.

Resource Assignment Capabilities – Gain greater visibility and control of valuable resources. The new Resource Assignment capability and corresponding Task List helps managers and team members to assign projects and tasks within Microsoft Solomon Project Controller to better manage worker activities and resources such as equipment.

Unified Project Desktop – Access Solomon information and processes via Microsoft Business Portal 2.5 for a complete picture of project financials, timecard and expense report entry, and more. If Microsoft Office Project is deployed and integrated to Solomon, project status as managed in Microsoft Office Project can also be viewed and updated from the same place, providing a complete, unified view of the project portfolio.

Enhanced Financials Integration with Project Management and Accounting – Maintain accurate views of each customer's receivable position on a project by using Accounts Receivable or Cash Manager modules to record the receipt of payments against project invoices. Now you can specify project and task information when you enter cash receipt transactions in Cash Manager. Cash batches posted to General Ledger include project and task information that make cash transactions available to the Project Controller Financial Transaction Transfer process, so that reduction in receivables is reflected in overall project profitability.

1034/1035 Invoicing Format – Reduce the time and effort required to produce 1034/1035 "Public Voucher for Purchases and Services other than Personal" forms. If you do business with US Government agencies that require form 1034/1035 for invoicing, you can now select this format for a project and generate it automatically with the Invoice Print function.

Historical Budgets by Period – Keep track of change orders by period with the new Historical Budgets by Period functionality, which provides change order trend information as well as the ability to run revenue recognition for a specific period.

Budget Labels and AIA Invoicing – Use flexible budget functionality to select company-specific labels and captions for EAC, FAC, and original budgets. In addition, new support for AIA (American Institute of Architects) invoicing, commonly used by architectural and construction firms, allows you to capture "other" line items for charges like freight or special handling.

Expandable Help Topics – Provide your employees with additional information about how to use Microsoft Solomon applications more effectively to help reduce training costs. Administrators can specify additional help files and user-defined explanations that workers can access within Project Management and Accounting screens for added assistance.

Keep informed and up-to-date about all aspects of your projects through the Project Center.

The Executive View allows an expanded picture of projects success. If an area of concern is identified, you can drill down easily to identify the root cause.

Assign both workers and other resources, such as equipment, to projects at the task level.

Field Service Management

Provide your employees with the information they need to track contract changes, deposits, and miscellaneous entries in order to deliver outstanding customer service. Microsoft Solomon 6.0 Field Service Management enhancements include the ability to view historical information and track all the important contract details your business needs.

Service Contract Change History and Audit Trail – Track and report contract value changes—from inception to completion—using the new Service Contract History and Service Contract Change Log, which allows you to review values changed, new values, previous values, when changes occurred, and who made the changes. Service Contract History provides customer service representatives with the information they need to deliver great service, as well as the history your business needs to track important contract details.

More Modules Offered in Microsoft Solomon Standard – Add the flexibility of Flat Rate Pricing to your Solomon Standard deployment. To provide a better solution for specific industries, Microsoft Solomon Standard now includes Flat Rate Pricing in its list of available modules.

Microsoft Solomon maintains a log of the changes that were made to your service contacts.

Distribution

Improve your organization's distribution management, efficiency, and performance.

Significant enhancements in Microsoft Solomon 6.0 Distribution enable greater financial and organizational control by providing a more accurate picture of inventory availability and reducing the possibility of overextending customer credit limits.

Consolidated Invoicing – Include multiple shippers on a single invoice with Consolidated Invoicing, a new feature in Order Management that allows you to define invoicing rules by customer. Rules that define how shippers and sales orders should be combined on invoice documents allow you to aggregate by PO number, contract number, buyer, and more. Define overall rules for how to combine shippers on invoices within the Order Management module, and easily override rules on a customer-by-customer basis when needed.

Improvements in Distribution Efficiency and Performance – Microsoft Solomon 6.0 offers improved allocation of inventory from all modules, lot and serial tracking, and negative inventory tracking. Additional enhancements include Process Manager optimization, the ability to prevent sales order entry for customers on Hold status, sequential invoice numbering capability within Accounts Receivable, and Purchase Order Consolidation.

Expanded Calculation of Inventory Availability – Get an accurate picture of inventory availability no matter how it is being used. All Microsoft Solomon modules that are capable of issuing, using, and adjusting inventory will now update the Quantity Available calculation automatically for improved Inventory accuracy and consistency.

Credit Limit Holds – Eliminate the possibility of overextending customer credit limits. Microsoft Solomon can help you better manage cash flow and prevent difficult situations with your customers by stopping the acceptance of new orders from customers whose credit limit has been exceeded.

Integrated Invoice Sequencing – Number invoices in Order Management in sequence with Accounts Receivable invoices, instead of in separate sequences for each module. Microsoft Solomon now provides a greater consistency in the numbering of invoices in the system, whether they originate from Accounts Receivable or Order Management.

Consolidated by PO Number

Consolidated by Contract

Consolidated by Buyer

Increase your customer's satisfaction with consolidated invoice creation that meets customer-specific needs.

Increase efficiencies for invoicing and shipping. Invoices can now be consolidated by:

- Sales Order
- Ship to
- Customer PO#
- Bill to Address
- Site ID
- Order Type
- Buyer ID
- Blanket Order Number
- Contract Number
- Department
- Division
- Mark For
- Tracking Number
- Any User Fields in the sales order shipper document

Analytics and Reporting

Transform data into meaningful information more easily than ever with new business intelligence and analytics capabilities. Easily tailor reports to the needs of individual users, export a report directly into a pivot table for automatic graphing in Microsoft Office Excel, publish Microsoft Office Word or Excel documents quickly, and more.

FRx Report Manager 6.7 – Combine Microsoft FRx reports and other information such as Microsoft Excel, Microsoft Word, or Microsoft PowerPoint® documents easily with Report Manager. Reports can be tailored to the needs of each individual user and delivered in one, comprehensive report book, making distribution of monthly, quarterly, and annual information easier than ever before. Report Books utilize the FRx reporting tree and its security so all of the financial data included in the report, regardless of its source, can be distributed with confidence and confidentiality.

Support for Crystal Reports 10 – Use new features and capabilities to review, edit, or design compelling data views via Microsoft Solomon support for the latest version of Crystal Reports. In addition, Crystal 10 support allows you to export to Excel, create funnel charts, utilize a format painter, and more.

Instant!OLAP – From Microsoft FRx Desktop through FRx Enterprise, Instant!OLAP is now included in every edition. Additional functionality includes the ability for users to utilize the instant!OLAP software output format and export a report directly into a pivot table for automatic graphing in Excel.

XBRL Technology – Transfer complex, highly confidential corporate financial information to regulators, banks, investors, and boards of directors using a trusted standard of financial communication: Extensible Business Reporting Language (XBRL) technology. Support for the 1.0 taxonomy has been upgraded to the 2.0 standard.

FRx WebView – Quickly publish Microsoft Word or Microsoft Excel documents with FRx reports for easy access by others on a secure intranet site. FRx WebView has been consolidated into FRx WebPort to form a single product module that is now available to all FRx users regardless of product edition or general ledger.

FRx Drilldown Viewer™ and Printing Options – Enable quicker export of reports to the FRx Drilldown Viewer, enhance printing options, and provide a more stable reporting environment. In addition, improvements to the way the general ledger index is built improves reliability.

Multiple output types, including FRx DrillDown Viewer, Microsoft Office documents, and reports produced from different reporting applications, can be packaged together and e-mailed, posted to a network or FRx WebPort site, or printed for hand delivery.

Report Manager helps you quickly and easily pull together all the documents you need to deliver a comprehensive report book. Report Book production can be scheduled or generated on-the-fly.

Draw on First-Rate Technical Support and Services

Recognized as one of the most responsive and innovative service teams in the industry, Microsoft Business Solutions backs your investment in Solomon by working with your local reselling partner to offer remarkable training and support services.

Regardless of which service plan you choose, you'll receive software updates and 24/7 access to CustomerSource, a Web site designed to enhance your productivity. If you enroll in Standard A, Standard B, or Premier Services, you'll receive expert technical support to help keep your business running smoothly, as well as access to online training to ensure you get up to speed quickly and continue to find new and better ways to use Solomon.
